

When I first got the assignment I was concerned that I wasn't going to know how to solve it.

After reading the problem a couple of times and jotting down some key aspects I was able to figure out how to start structuring my solution.

I revised the concept of Depth First search and reviewed the examples we covered in class.

I then tinkered around with the code, making the requisite changes for it to work for my problem

I really enjoyed the peer review process and gained a lot of perspective from my partner's code and process.

I liked that the code was clear to understand and followed a discernible logic.

It was a formative experience to see how there is individuality in solving coding problems.

It can be as much as art, as it is science.
